

Air Bubbles in Returns

If you have air in your returns, the easiest thing is to check the skimmer weir doors. Sometimes, they can get stuck in the up position and the pool will start sucking air from the skimmers. If the weir doors are stuck, simply push them into the skimmer to free a stuck pivot point and you may have solved your problem.

If you continue to have air in your returns, please download our **Low Pressure with Air** guide for more information.
